

Linear programming solves problems of the following form:

$$\begin{aligned} \min_x \quad & c^T x \\ \text{such that} \quad & A_{ub} x \leq b_{ub}, \\ & A_{eq} x = b_{eq}, \\ & l \leq x \leq u, \end{aligned}$$

where x is a vector of decision variables; c , b_{ub} , b_{eq} , l , and u are vectors; and A_{ub} and A_{eq} are matrices.
